

SkyCharts 2000

By Ed Stewart

These charts were prepared by visually scanning the Sky Atlas 2000 charts and manually cataloging the NGC, IC, and M objects in two hour of RA “swaths” from +90° Dec (north) to -90° Dec. This allows an observer to use a computer controlled telescope or a scope equipped with DSCs (Digital Setting Circles) to concentrate on a small area of the sky—thus conserving time and power wasted slewing large distances to the next object. The NGC and IC catalogs are listed in increasing RA, but are unrestricted in Dec, meaning that, for example:

NGC XXX1 might be at RA 4 hrs, 0 min and Dec +88° while

NGC XXX2 might be at RA 4 hrs, 1 min and Dec -88°.

Resulting in a nearly 180° swing of the scope in Dec for consecutive NGC catalog numbers. So going through the catalogs in numerical order is not efficient use of power or time.

Also makes a very convenient method for creating an observing session by simply getting out the SkyChart(s) that are in a good part of the sky at that point in time.

Any comments or questions, please e-mail me at:
